NAAN MUDHALVAN PROJECT

SCRIPT-CONTROLLED ACL – RESTRICT RECORD ACCESS BASED ON FIELD VALUE

1. Brainstorming & Ideation Phase

Purpose

To identify a practical access-control problem and propose a solution that restricts record access according to a field value.

Problem Identified

A normal access rule may allow users to access records without considering a particular record field. This can expose records to users who should not view them.

Project Idea

Develop a script-controlled Access Control List (ACL) that checks a selected field value before allowing a user to access a record.

Proposed Solution

Use a scripted ACL condition to evaluate the field value and the user's access context. Access is granted only when the defined rule is satisfied.

Expected Outcome

Improve record-level security, reduce unauthorized access, and demonstrate how scripting can extend standard ACL behaviour.
