NAAN MUDHALVAN PROJECT

SCRIPT-CONTROLLED ACL – RESTRICT RECORD ACCESS BASED ON FIELD VALUE

2. Requirement Analysis Phase

Functional Requirements

Create an ACL rule; identify the target table/record; read the required field value; evaluate the access condition; allow or deny access based on the script result.

User Requirements

Authorized users should be able to view permitted records, while users who do not satisfy the field-based condition should be denied access.

Software Requirements

ServiceNow development instance, browser, JavaScript scripting support, and access-control configuration capability.

Data Requirements

A suitable table with a field whose value determines access, together with test records representing allowed and restricted cases.

Security Requirements

The ACL must follow least-privilege principles and must not expose restricted records through unintended access paths.

Non-Functional Requirements

The rule should be understandable, maintainable, consistent, and efficient enough for normal record access.
