NAAN MUDHALVAN PROJECT

SCRIPT-CONTROLLED ACL – RESTRICT RECORD ACCESS BASED ON FIELD VALUE

3. Project Design Phase

Architecture

User Request → ACL Evaluation → Script Reads Field Value → Condition Check → Allow/Deny Decision → Record Access.

ACL Design

Configure a record-level ACL on the selected table and operation. The script returns a true/false decision based on the configured field value.

Field-Based Logic

The design identifies a controlling field, compares its value with the required condition, and permits access only when the comparison succeeds.

Security Design

Access is denied by default when the condition is not satisfied. The design follows minimum-access principles.

Test Design

Prepare allowed, denied, boundary, and invalid-data cases so the ACL behaviour can be verified before deployment.
