NAAN MUDHALVAN PROJECT

SCRIPT-CONTROLLED ACL – RESTRICT RECORD ACCESS BASED ON FIELD VALUE

5. Project Development Phase

Environment Setup

Open the development instance, identify the target table and field, and prepare suitable test records and users.

ACL Configuration

Create/configure the appropriate ACL for the required table and operation. Select the field and access condition used by the project.

Script Development

Implement the scripted condition so that the relevant field value is evaluated and the ACL returns an allow/deny decision.

Validation During Development

Test the rule with users and records that satisfy and do not satisfy the field condition.

Version Control

Maintain the project files, screenshots, notes, and documentation in the GitHub repository using the required phase-wise structure.
